CSCI 2021: Binary, Integers, Arithmetic

Chris Kauffman

Last Updated: Mon Feb 8 09:45:09 AM CST 2021

Logisitcs

Reading

- C references: whole language:
- ► Bryant/O'Hallaron Ch 2.1-3

Goals

- Binary Representations / Notation
- Integers in binary
- Arithmetic operations

Assignments

- ▶ P1 Ongoing
- ► Lab03 on File Input
- ► HW03 on Binary Ints

Date	Event
Mon 2/8	Binary Ints/Chars
Wed 2/10	Lec/Lab Review
•	Project 1 Due
Fri 2/12	Exam 1
Mon 2/15	Bit-level Ops
Wed 2/17	Feedback Survey
	Due

NOTE: font_load() tutorial posted

Announcements: Course Feedback Survey on Canvas

- Will post a Feedback Survey tomorrow on Canvas, due a week later
- Anonymous, worth 1 Engagement Point in place of Lab04
- Soliciting feedback on various aspects of the course, both numerically and free-form
- ▶ If you have had good/bad/ugly experiences so far, this will be your chance to weigh in

NOTE: An old version of the survey was accidentally left open on Canvas and has been deleted. If you took this version, you will still need to fill out the one released on Wed.

Unsigned Integers: Decimal and Binary

Unsigned integers are always positive:

To understand binary, recall how decimal numbers "work"

Decimal: Base 10 Example

Each digit adds on a power 10

Binary: Base 2 Example Each digit adds on a power 2

So, $11001_2 = 25_{10}$

Exercise: Convert Binary to Decimal

Base 2 Example:

So, $11001_2 = 25_{10}$

$$11001 = 1 \times 2^{0} + 1$$

$$0 \times 2^{1} + 0$$

$$0 \times 2^{2} + 0$$

$$1 \times 2^{3} + 8$$

$$1 \times 2^{4} + 16$$

$$= 1 + 8 + 16 = 25$$

Try With a Pal

Convert the following two numbers from base 2 (binary) to base 10 (decimal)

- **111**
- **11010**
- **01100001**

į

Answers: Convert Binary to Decimal

$$\begin{aligned} 111_2 = & 1 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 \\ = & 1 \times 4 + 1 \times 2 + 1 \times 1 \\ = & 7_{10} \\ 11010_2 = & 1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 \\ = & 1 \times 16 + 1 \times 8 + 0 \times 4 + 1 \times 2 + 0 \times 1 \\ = & 26_{10} \\ 01100001_2 = & 0 \times 2^7 + 1 \times 2^6 + 1 \times 2^5 + 0 \times 2^4 \\ & + 0 \times 2^3 + 0 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 \\ = & 0 \times 128 + \times 64 + 1 \times 32 + 0 \times 16 \\ & + 0 \times 8 + 0 \times 4 + 0 \times 2 + 1 \times 1 \\ = & 97_{10} \end{aligned}$$

Note: last example ignores leading 0's

The Other Direction: Base 10 to Base 2

Converting a number from base 10 to base 2 is easily done using repeated division by 2; keep track of **remainders**

Convert 124 to base 2:

$124 \div 2 = 62$	rem 0
$62 \div 2 = 31$	rem 0
$31 \div 2 = 15$	rem 1
$15 \div 2 = 7$	rem 1
$7 \div 2 = 3$	rem 1
$3 \div 2 = 1$	rem 1
$1 \div 2 = 0$	rem 1

- ► Last step got 0 so we're done.
- ▶ Binary digits are in remainders in reverse
- Answer: 1111100
- ► Check:

$$0 + 0 + 2^2 + 2^3 + 2^4 + 2^5 + 2^6 = 4 + 8 + 16 + 32 + 64 = 124$$

Decimal, Hexadecimal, Octal, Binary

- Numbers exist independent of any writing system
- Can write the same number in a variety of bases
- C provides syntax for most common bases used in computing

Decimal	Binary	Hexadecimal	Octal
10	2	16	8
125	1111101_2	7D ₁₆	175 ₈
None	0b	0x	0
125	0b1111101	0x7D	0175
	10 125 None	10 2 125 1111101 ₂ None 0b	10 2 16 125 1111101 ₂ 7D ₁₆ None 0b 0x

- ► **Hexadecimal** often used to express long-ish byte sequences Larger than base 10 so for 10-15 uses letters A-F
- Examine number_writing.c and table.c for patterns
- ► **Expectation**: Gain familiarity with doing conversions between bases as it will be useful in practice

Hexadecimal: Base 16

- Hex: compact way to write bit sequences
- ▶ One byte is 8 bits
- Each hex character represents 4 bits
- ► Each Byte is 2 hex digits

1		I
Byte	Hex	Dec
0101 0111	57 = 5*16 + 7	87 87
	3C = 3*16 + 12	60
	E2 = 14*16 + 2	226
		+

Hex to 4 bit equivalence

Dec	Bits	Hex
0	0000	0
1	0001	1
2	0010	2
3	0011	3
4	0100	4
5	0101	5
6	0110	6
7	0111	7
8	1000	8
9	1001	9
10	1010	Α
11	1011	В
12	1100	C
13	1101	D
14	1110	Е
15	1111	F

Exercise: Conversion Tricks for Hex and Octal

Examples shown in this week's HW, What tricks are illustrated?

 Decimal	+ Byte = 8bits	+ Byte by 4	+ Hexadecimal
87 87	01010111	bin: 0101 0111 hex: 5 7	57 = 5*16 + 7
 60 	 00111100 		3C = 3*16 + 12
 226 	11100010		E2 = 14*16 + 2
1			
Decimal	Byte = 8bits	Byte by 3	Octal
Decimal 87 	+	+	Octal 127 = 1*8^2 + 2*8 + 7 oct dec
	01010111 01010111	bin: 01 010 111 oct: 1 2 7	+

Answers: Conversion Tricks for Hex and Octal

Converting between Binary and Hexadecimal is easiest when grouping bits by 4: each 4 bits corresponds to one hexadecimal digit

```
bin: 0101 0111 bin: 1110 0010 hex: 5 7 hex: E=14 2
```

► Converting between Binary and Octal is easiest when grouping bits by 3: each 3 bits corresponds to one octal digit

```
bin: 01 010 111 bin: 11 100 010 oct: 1 2 7 oct: 3 4 2
```

Unix Permissions with Octal

- Octal arises associated with Unix file permissions
- Every file has 3 permissions for 3 entities
- ▶ Permissions are true/false so a single bit will suffice
- Octal historically used for this
- ▶ 1s -1: long list files, shows permissions
- chmod 665 somefile.txt: change permissions of somefile.txt to those shown to the right
- chmod 777 x.txt: open to everyone
- Symbolic chmod invocations are often preferred

Readable chmod version: chmod u=rw,g=rw,o=rx somefile.txt

Character Coding Conventions

- Would be hard for people to share words if they interpretted bits as letters differently
- ► **ASCII**: American Standard Code for Information Interchange An old standard for bit/character correspondence
- ▶ 7 bits per character, includs upper, lower case, punctuation

Dec	Hex	Binary	Char	Dec	Hex	Binary	Char
65	41	01000001	Α	78	4E	01001110	N
66	42	01000010	В	79	4F	01001111	0
67	43	01000011	C	80	50	01010000	P
68	44	01000100	D	81	51	01010001	Q
69	45	01000101	E	82	52	01010010	Ř
70	46	01000110	F	83	53	01010011	S
71	47	01000111	G	84	54	01010100	Т
72	48	01001000	Н	85	55	01010101	U
73	49	01001001	1	86	56	01010110	V
74	4A	01001010	J	87	57	01010111	W
75	4B	01001011	K	88	58	01011000	Χ
76	4C	01001100	L	89	59	01011001	Υ
77	4D	01001101	M	90	5A	01011010	Z
91	5B	01011101	[97	61	01100001	а
92	5C	01011110	\	98	62	01100010	b

Unicode

► World: why can't I write

in my code/web address/email?

- America: ASCII has 128 chars. Deal with it.
- World: Seriously?
- America: We invented computers. 'Merica!
- ► World:

- America: ... Unicode?
- World: But my language takes more bytes than American.
- America: Deal with it. 'Merica!

- ► ASCII Uses 7 bits per char, limited to 128 characters
- ► UTF-8 uses **1-4 bytes per character** to represent **many**more characters
 (1,112,064 codepoints)
- Uses 8th bit in a byte to indicate extension to more than a single byte
- Requires software to understand coding convention allowing broader language support
- ASCII is a proper subset of UTF-8 making UTF-8 backwards compatible and increasingly popular

Binary Integer Addition/Subtraction

Adding/subtracting in binary works the same as with decimal EXCEPT that carries occur on values of 2 rather than 10

```
ADDITION #1
                         SUBTRACTION #1
   1 11 <-carries
                                   ? <-carries
  0100 \ 1010 = 74
                           0111 \ 1001 = 121
+ 0101 1001 = 89
                         - 0001 0011 = 19
   1010\ 0011 = 163
                            VVVVVVVVVVVVVVV
                            VVVVVVVVVVVVV
ADDITION #2
                            VVVVVVVVVVVVV
   1111 1 <-carries
                                 x12 <-carries
  0110 1101 = 109
                          0111 \ 0001 = 119
+ 0111 1001 = 121
                         - 0001 0011 = 19
  1110\ 0110 = 230
                         0110 \ 0110 = 102
```

Two's Complement Integers: Representing Negative Values

- ► To represent negative integers, must choose a coding system
- ▶ Two's complement is the most common for this
- Alternatives exist
 - ▶ Signed magnitude: leading bit indicates pos (0) or neg (1)
 - One's complement: invert bits to go between positive negative
- Great advantage of two's complement: signed and unsigned arithmetic are identical
- ► Hardware folks only need to make one set of units for both unsigned and signed arithmetic

Summary of Two's Complement

Short explanation: most significant bit is associated with a negative power of two.

```
UNSTGNED BINARY
                     TWO's COMPLEMENT (signed)
-----
7654 3210 : position 7654 3210 : position
ABCD EFGH: 8 bits ABCD EFGH: 8-bits
A: 0/1 * + (2^7) *POS* A: 0/1 * -(2^7) *NEG*
B: 0/1 * + (2^6) B: 0/1 * + (2^6)
C: 0/1 * + (2^5) C: 0/1 * + (2^5)
H: 0/1 * +(2^0)
                     H: 0/1 * +(2^0)
UNSTGNED BINARY
                     TWO's COMPLEMENT (signed)
7654 3210 : position 7654 3210 : position
1000\ 0000 = +128
                     1000\ 0000 = -128
1000 0001 = +129
                    1000\ 0001 = -127 = -128+1
1000\ 0011 = +131
                    1000\ 0011 = -125 = -128 + 1 + 2
1111 1111 = +255
                     1111 \ 1111 = -1 = -128 + 1 + 2 + 4 + \ldots + 64
                     0000 \ 0000 = 0
0000 \ 0001 = +1
                     0000\ 0001 = +1
0000 0101 = +5
                   0000\ 0101 = +5
0111 \ 1111 = +127
                    0111 \ 1111 = +127
```

Two's Complement Notes

- Leading 1 indicates negative, 0 indicates positive
- ► All 0's = Zero
- Positive numbers are identical to unsigned

Conversion Trick

Positive -> Negative

► Invert bits, Add 1

Negative -> Positive

► Invert bits, Add 1

Same trick works both ways, implemented in hardware for the **unary minus** operator as in

int
$$y = -x;$$

```
~ 1001 1000 = negative, invert
  0110 \ 0111 = +103 \ inverted
  0110\ 1000 = +104\ (original = -104)
~ 0110 1000 pos to neg
  1001 0111
             inverted
  1001 \ 1000 = -104
original bits
```

Add Pos/Neg should give 0

```
1 1111 <-carries
0110 1000 = +104
+ 1001 1000 = -104
------
x 0000 0000 = zero
```

Overflow

- Sums that exceed the representation of the bits associated with the integral type overflow
- Excess significant bits are dropped
- Addition can result in a sum smaller than the summands, even for two positive numbers (!?)
- Integer arithmetic in fixed bits is a mathematical ring

Examples of Overflow in 8 bits

ADDITION #3 OVERFLOW	ADDITION #4 OVERFLOW
1 1111 111 <-carries	1 1 <-carries
1111 1111 = 255	1010 1001 = 169
+ 0000 0001 = 1	+ 1100 0001 = 193
1 0000 0000 = 256	1 0110 1010 = 362
x drop 9th bit	x drop 9th bit
$0000\ 0000 = 0$	0110 1010 = 106

Underflow

- Underflow occurs in unsigned arithmetic when values go below 0 (no longer positive)
- Pretend that there is an extra significant bit to carry out subtraction
- Subtracting a positive integer from a positive integer may result in a larger positive integer (?!?)
- Integer arithmetic in fixed bits is a mathematical ring

Examples of 8-bit Underflow

```
SUBTRACTIION #2 UNDERFLOW
           ?<-carries
   0000 0000 =
  0000 0001 =
           ?<-carries
1\ 0000\ 0000 = 256\ (pretend)
- 0000 0001 =
           2<-carries
0\ 1111\ 1110\ =\ 256
  0000 0001 =
   1111 \ 1111 = 255
```

Overflow and Underflow In C Programs

- See over_under_flow.c for demonstrations in a C program.
- ▶ No runtime errors for under/overflow
- Good for hashing and cryptography
- ▶ Bad for most other applications: system critical operations should use checks for over-/under-flow
- See textbook Arianne Rocket crash which was due to overflow of an integer converting from a floating point value
- At assembly level, there are condition codes indicating that overflow has occurred

Endinaness: Byte ordering in Memory

- Single bytes like ASCII characters lay out sequentially in memory in increasing address
- Multi-byte entities like 4-byte ints require decisions on byte ordering
- ▶ We think of a 32-bit int like this

Decimal: 6377

- But need to assign memory addresses to each byte
 - Little Endian: least significant byte early
 - Big Endian: most significant byte early
- Example: Integer starts at address #1024

Address

LittleEnd:	#1027	7	#1026	3	#102	5	#1024	1
Binary:	0000	0000	0000	0000	0001	1000	1110	1001
	0	0	0	0	1	8	E	9
BigEnd:	#1024	1	#1025	5	#1026	3	#1027	7
	Addra	200						

Little Endian vs. Big Endian

- Most modern machines use little endian by default
- Processor may actually support big endian
- ▶ Both Big and Little Endian have engineering trade-offs
- At one time debated hotly among hardware folks: a la Gulliver's Travels conflicts
- Intel chips were little endian and "won" so set the basis for most modern use
- Big endian byte order shows up in network programming: sending bytes over the network is done in big endian ordering
- Examine show_endianness.c to see C code to print bytes in order
- ► Since most machines are little endian, will see bytes print in the revers order usually think of them

Output of show_endianness.c

```
1 > cat show endianness.c
 2 // Show endiannes layout of a binary number in memory Most machines
 3 // are little endian so bytes will print leas signficant earlier.
   #include <stdio.h>
   int main(){
      int bin = 0b000000000000000001100011101001:
                                                      // 6377
     //
                                                  // show decimal/hex of binary
10
     printf("%d\n%x\n",bin,bin);
     unsigned char *ptr = (unsigned char *) &bin; // pointer to beginning of bin
11
12
     for(int i=0: i<4: i++){
                                                  // print bytes of bin from low
       printf("%x ", ptr[i]);
                                                  // to high memory address
13
14
15
     printf("\n"):
16
     return 0:
17
   > gcc show endianness.c
19
20 > ./a.out
21 6377
22 18e9
23 e9 18 0 0
```

Notice: num prints with value 18e9 but bytes appear in reverse order e9 18 when looking at memory

Integer Ops and Speed

- Along with Addition and Subtraction, Multiplication and Division can also be done in binary
- Algorithms are the same as base 10 but more painful to do by hand
- This pain is reflected in hardware speed of these operations
- The Arithmetic and Logic Unit (ALU) does integer ops in the machine
- A clock ticks in the machine at some rate like 3Ghz (3 billion times per second)

Under ideal circumstances, typical ALU Op speeds are

Operation	Cycles
Addition	1
Logical	1
Shifts	1
Subtraction	1
Multiplication	3
Division	>30

- Due to disparity, it is worth knowing about relation between multiply/divide and bitwise operations
- Compiler often uses such tricks: shift rather than multiply/divide

Mangling bits puts hair on your chest

Below contrasts difference between logical and bitwise operations.

- Bitwise ops evaluate on a per-bit level
- 32 bits for int, 4 bits shown

Bitwise OR	Bitwise AND	Bitwise XOR	Bitwise NOT
1100 = 12	1100 = 12	1100 = 12	
1010 = 10	& 1010 = 10	^ 1010 = 10	~ 1100 = 12
1110 = 14	1000 = 8	0110 = 6	0011 = 3

Bitwise Shifts

- ▶ **Shift** operations move bits within a field of bits
- Shift operations are

```
x = y \ll k; // left shift y by k bits, store in x x = y \gg k; // right shift y by k bits, store in x
```

- ▶ All integral types can use shifts: long, int, short, char
- ▶ **Not applicable** to pointers or floating point
- Examples in 8 bits

```
// 76543210
char x = 0b00010111; // 23
char y = x << 2; // left shift by 2
// y = 0b01011100; // 92
// x = 0b00010111; // not changed
char z = x >> 3; // right shift by 3
// z = 0b00000010; // 2
// x = 0b00010111; // not changed
char n = 0b10000000; // -128, signed
char s = n >> 4; // right shift by 4
// s = 0b11111000; // -8, sign extension
// right shift >> is "arithmetic"
```

Shifty Arithmetic Tricks

- Shifts with add/subtract can be used instead of multiplication and division
- ► Turn on optimization: gcc -03 code.c
- Compiler automatically does this if it thinks it will save cycles
- Sometimes programmers should do this but better to convince compiler to do it for you, comment if doing manually

Multiplication

Division

```
76543210
       76543210
                             char y = 0b01101110; // 110
char x = 0b00001010; // 10
                             char y2 = y >> 1; // 110/2
char x2 = x << 1; // 10*2
                             // y2 = 0b00110111; // 55
// x2 = 0b00010100; // 20
                             char y4 = y >> 2; // 110/4
char x4 = x << 2; // 10*4
                             // y4 = 0b00011011; // 27
// x4 = 0b00101000; // 40
                             char z = 0b10101100: // -84
char x7 = (x << 3)-x; // 10*7
                             char z2 = z \gg 2; // -84/4
// x7 = (x * 8)-x; // 10*7
                             // z2 = 0b11101011; // -21
// x7 = 0b01000110: // 70
                                 right shift sign extension
          76543210
//
```

Exercise: Checking / Setting Bits

Use a combination of bit shift / bitwise logic operations to...

- 1. Check if bit i of int x is set (has value 1)
- 2. Clear bit i (set bit at index i to value 0)

Show C code for this

Answers: Checking / Setting Bits

1. Check if bit i of int x is set (has value 1)

2. Clear bit i (set bit at index i to value 0)

```
int x = ...;
int mask = 1; // or 0b0001 or 0x01 ...
int shifted = mask << i; // shifted 0b00...010..00
int inverted = ~shifted; // inverted 0b11...101..11
x = x & inverted; // x & 0b10...010..01
... // 0b10...000..01</pre>
```

Showing Bits

printf() capabilities:

```
%d as Decimal
%x as Hexadecimal
%o as Octal
%c as Character
```

- No specifier for binary
- Can construct such with bitwise operations
- Code pack contains two codes to do this
 - printbits.c: single args printed as 32 bits
 - showbits.c: multiple args printed in binary, hex, decimal

- Showing bits usually involves shifting and bitwise AND &
- Example from showbits.c

```
#define INT_BITS 32
// print bits for x to screen
void showbits(int x){
  int mask = 0x1:
  for(int i=INT_BITS-1; i>=0; i--){
    int shifted mask = mask << i;</pre>
    if(shifted_mask & x){
      printf("1");
    } else {
      printf("0");
```

Bit Masking

- Semi-common for functions to accept bit patterns which indicate true/false options
- Frequently makes use of bit masks which are constants associated with specific bits
- Example from earlier: Unix permissions might be...

```
#define S_IRUSR 0b100000000 // User Read
#define S_IWUSR 0b010000000 // User Write
#define S_IXUSR 0b001000000 // User Execute
#define S_IRGRP 0b000100000 // Group Read
...
#define S_IWOTH 0b000000010 // Others Write
#define S_IXOTH 0b000000001 // Others Execute
```

Use them to create options to C functions like
int permissions = S_IRUSR|S_IWUSR|S_RGRP;
chmod("/home/kauffman/solution.zip",permissions);
